

3. Configuring protractor in IntelliJ Idea

Configuring IntelliJ Idea for NodeJS

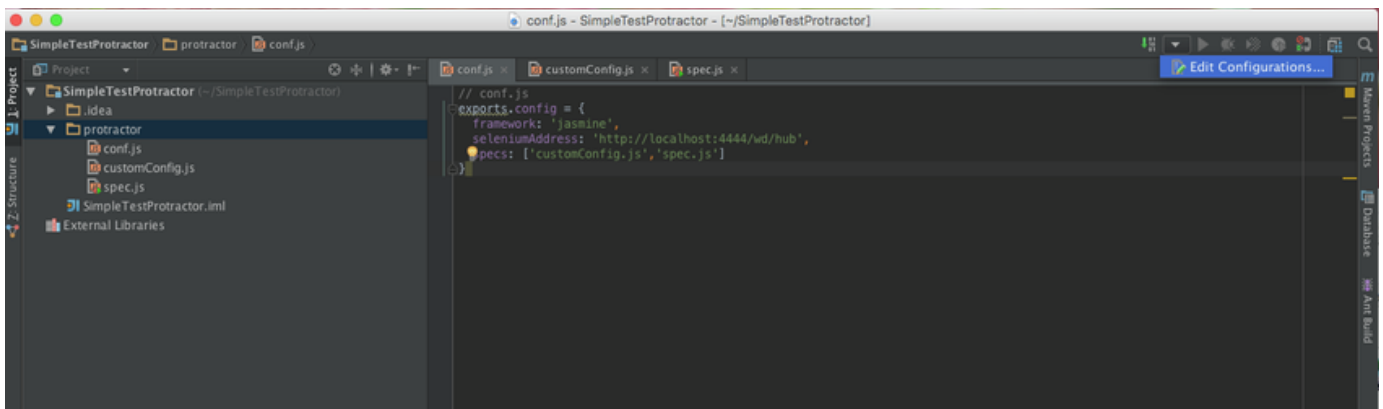

Step 1: Go to Preferences Plugin NodeJS Install JetBrains Plugin

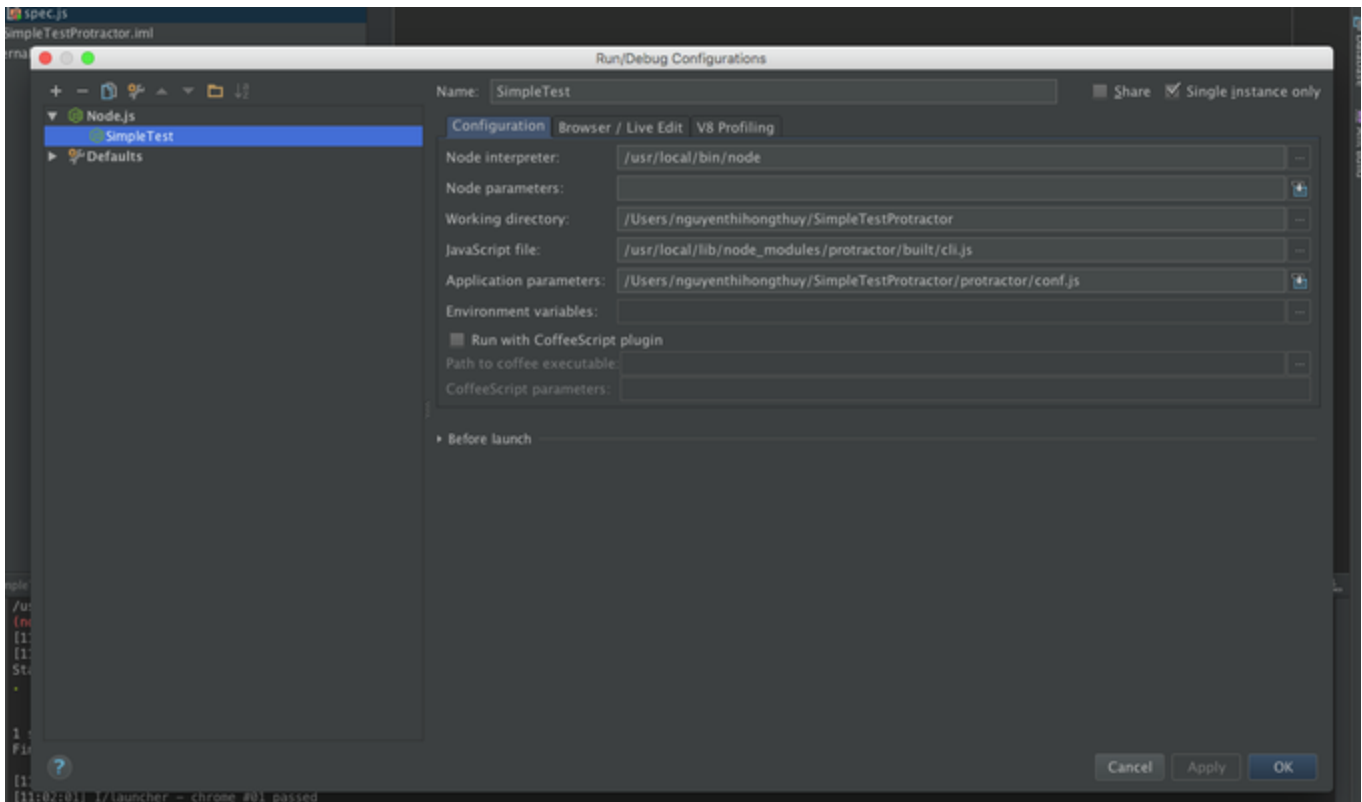

Step 2: Create Project with NodeJS

Step 3: Configuration to run the project

- **Node interpreter:** Path to the **node.exe** . If you have installed node.exe in your machine , this field will be auto-populated .
- **Working Directory:** Path to the directory where your project is. by default it takes the path of the current project opened and is also auto-populated.
- **JavaScript File:** In this you have to provide the path of **cli.js** which is inside the lib folder for protractor module. For more reference you can see the above image.
- **Application Parameter:** In this you have to provide the path of your **configuration** file which is required by protractor for executing the test
- **Name:** In this you have to provide the name of your test, if you don't provide any name, your test will be saved as **Unnamed**.

Step 4: Run the project
